                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                polypeptide or polynucleotide, and optionally at least I other M. Catarrhalis antigen. A method for diagnosing a M. catarrhalis infection involves identifying a BASBO81 polypeptide, or an antibody that is immunospecific for it, in a sample. A therapeutic composition useful in treating M. catarrhalis diseases in humans comprises an antibody directed against a BASBO81 polypeptide. The disease can be a bacterial infection, e.g. otitis media in infants and children, pneumonia in elderlies, sinusitis, nosocomial infections and invasive diseases, chronic otitis media with hearing loss, fluid accumulation in the middle ear, auditive nerve damage, inflammation of the middle ear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            protein. It shows 99.9% homology in the mature region to a sequence (see AAY95988) deduced from a PCR product. The invention provides BASB081 polypeptides, polypucleotides, expression vectors, host cells, and a process for producing a BASB081 polypeptide. Also provided are vaccine compositions comprising a BASB081.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence

amino acid sequence homology to Neisseria meningitidis omp85 outer membrane protein. The sequence was deduced from PCR-amplified DNA (see AAA50537), and shows 99.9% homology to the mature region of a BASB081 gene translation product (see AAY95987). The invention provides BASB081 polypeptides, polynucleotides, expression vectors, bost cells, and a process for producing a BASB081 polypeptide. Also provided are vaccine compositions comprising a BASB081 polypeptide cor polynucleotide, and optionally at least 1 other M. catarrhalis antigen. A method for diagnosing a M. catarrhalis infection involves identifying a BASB081 polypeptide, or an antibody that is immunospecific for it, in a sample. A therapeutic composition cuseful in treating M. catarrhalis diseases in humans comprises an antibody directed against a BASB081 polypeptide. The disease can be a bacterial infection, e.g. otitis media in infants and children, contained the middle ear, sudditive nerve damage, delayed cof the middle ear.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches

        The present sequence is that of outer membrane protein BASB067 of Haemophilus influenzae strain Rd KW20. BASB067 is a surface expressed protein that is recognised by the immune system. It shows 23% identity to the protective surface antigen DIS of H. influenzae and has a similar secondary structure. Its N-terminal domain is predicted to contain a mixture of alpha-helix and beta-strands, and could be used as a vaccine antigen. The C-terminal domain is predicted to form a beta-barrel composed of anti-parallel, amphipathic beta-strands. The external loops of the beta-barrels of integral outer membrane proteins frequently contain immunodominant B-cell epitopes, making the C-terminal domain of BASB067 a strong candidate vaccine antigen.                                                                                                  AAY95821 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     production of BASB067 polypeptides and polynucleotides, for use especially in therapeutic and prophylactic vaccines. It also relates to methods for using such polypeptides and polynucleotides in the prevention and treatment of microbial diseases, in diagostic assays for detecting diseases associated with microbial infections, and assays for detecting expression or activity of BASB067 polypucleotides. Antibodies raised against BASB067 can be used to treat humans with H. influenzae disease.

                                                                                                                                                                                                 The present sequence is that of outer membrane protein BASB067 of CHaemophilus influenzae non-typeable (NtHi) strain 289. BASB067 is CC a surface expressed protein that is recognised by the immune system. CC It shows homology to the protective surface antigen D15 of CH. influenzae and has a similar secondary structure. Its CH. influenzae and has a similar secondary structure of alpha-helix CC and beta-strands, and could be used as a vaccine antigen. The CC creminal domain is predicted to form a beta-barrel composed of CC anti-parallel, amphipathic beta-strands. The external loops of CC anti-parallel, amphipathic beta-strands Trequently CC contain immunodominant B-cell epitopes, making the C-terminal CC domain of BASB067 a strong candidate vaccine antigen. The CC contain immunodominant B-cell epitopes, making the C-terminal CC domain of BASB067 a strong candidate vaccine antigen. The CC especially in therapeutic and polynucleotides for the production of BASB067 polypeptides and polynucleotides. It also CC especially in therapeutic and prophylactic vaccines. It also CC especially in therapeutic and prophylactic vaccines, in diagostic and seases for detecting diseases associated with microbial infections, and appears of a detecting diseases associated with microbial infections,
                                                                                                                       Matches

Neisseria meningitidis colonises the pharynx, causing meningitis and, occasionally, septicaemia in the absence of meningitis. This antigenic protein is useful in the manufacture of a medicament for treating or preventing infection due to Neisseria bacteria, such as meningitis and septicaemia. It is also useful as a diagnostic reagent for detecting the presence of Neisseria bacteria or antibodies raised against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Neisseria, and as a reagent for raising the antibodies. The Nei
nucleotide sequences can be expressed in a variety of different
expression systems, for example, mammalian cells, baculoviruses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel 85 kDa antigen from Neisseria meningitidis and Neisseria gonorrhoeae, useful in the manufacture of a medicament for tre preventing Neisserial bacteria infection -

       The present sequence represents a Neisseria gonorrheae protein. The protein is used to produce the compositions of the invention. The specification describes a composition, comprising a Neisseria meningitidis serogroup B outer membrane preparation and an immunogenic component. The immunogenic component is protein disclosed in W099/57280, W099/36544, W099/24578, W099/6791, W097/28273, W096/29412, W095/03413, W099/31132, W099/58683, W099/55873, and/or N. meningitidis protein PorA, TbpB, PilC, OpA, or Omp85. The composition is used for making TbpA, TbpB, PilC, OpA, or Omp85. The composition is used for making

                                                                                                                                                                                                                                                                                                                        The present invention describes an immunogenic composition (I) comprising a Neisseria antigen and an adjuvant composition comprising an oligonucleotide comprising at least I CG motif. Also described is an adjuvant composition (II) comprising an oligonucleotide which comprises at least I CG motif and a complete Freund's adjuvant (CFA), where the oligonucleotide preferably comprises at least one phosphorothicate bond. AAA92359 to AAA92385 represent specifically claimed oligonucleotides of the present invention. (I) is useful for stimulating an immune response in a mammal, preferably a human, against Neisseria infection, preferably Neisseria meningitidis infection and in the manufacture of a medicament for inducing a protective immune response in a mammal. The present sequence represents the claimed Neisseria gonorrheae amino acid sequence disclosed in GB-9928197.4, which is given in the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents an outer membrane protein (omp) 85 of Neisseria gonorrhoeae. The omp polypeptides and polynucleotides are useful in compositions for use in the prevention, treatment and diagnosis of non-symptomatic gonococcal infection or meningococcal infection and symptomatic disease. They are also useful for the detection of hybridisation complexes. Antigens and antibodies specific omp proteins also provide diagnostic, therapeutic and prophylactic compositions for the treatment or prevention of the infections described above. The antibodies are useful for inducing a protective immune response in humans or animals with N. gonorrhoeae, N. meningitidis, or other Neisseria species. The proteins, antibodies and polynucleotide sequences of the present invention may also be used in the screening and development of chemical property.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence represents a Neisseria meningitidis serogroup B 85 kDa antigenic protein. Neisseria meningitidis colonises the pharynx, causing meningitis and, occasionally, septicaemia in the absence of meningitis. This antigenic protein is useful in the manufacture of a medicament for treating or preventing infection due to Neisseria bacteria, such as meningitis and septicaemia. It is also useful as a diagnostic reagent for detecting the presence of Neisseria bacteria or antibodies raised against Neisseria, and as a reagent for raising the antibodies. The Neisserial nucleotide sequences can be expressed in a variety of different expression systems, for example, mammalian cells, baculoviruses, plants,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 1; Fig 1; 92pp;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    B
                                             The sequence represents a Neisseria gonorrhoeae 85 kDa antigenic protein. N. gonorrhoeae is closely related to N. meningitidis, which colonises the pharynx, causing meningitis and, occasionally, septicaemia in the absence of meningitis. This antigenic protein is useful in the manufacture of a medicament for treating or preventing infection due to Neisseria bacteria, such as meningitis and septicaemia. It is also useful as a diagnostic reagent for detecting the presence of Neisseria bacteria or antibodies raised against Neisseria, and as a reagent for raising the antibodies. The Neisserial nucleotide sequences can be expressed in a variety of different expression systems for example members.

Neisseria meningitidis colonises the pharynx, causing meningitis and, occasionally, septicaemia in the absence of meningitis. This antigenic protein is useful in the manufacture of a medicament for treating or preventing infection due to Neisseria bacteria, such as meningitis and septicaemia. It is also useful as a diagnostic reagent for detecting the presence of Neisseria bacteria or antibodies raised against Neisseria, and as a reagent for raising the antibodies. The Neisserial nucleotide sequences can be expressed in a variety of different expression systems, for example, mammalian cells, baculoviruses, plants,

The immunogenic component is protein disclosed in W099/57280, W099/36544, W099/24578, W099/66791, W097/28273, W099/29412, W095/03413, W099/31132, W099/58683, W099/5873, and/or N. meningitidis protein PorA, TbpB, PilC, OpA, or Omp85. The composition is used for making a medicament for treating or preventing infection due to Neisserial bacteria; a diagnostic reagent for detecting the presence of Neisserial bacteria; a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised against Neisserial bacteria; and/or a reagent which can raise antibodies against Neisserial bacteria. It may also be used as a vaccine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Composition for treating or preventing infection to, detecting, or for raising antibodies against Neisserial bacteria, comprises an N. meningitidis serogroup B outer membrane preparation and an immunogenic component.

The protein is used to produce the compositions of the invention. The specification describes a composition, comprising a Neisseria meningitidis serogroup B outer membrane preparation and an immunogenic component. The immunogenic component is protein disclosed in W099/57280, W099/36144, W099/24578, W099/6791, W097/28273, W095/29412, W095/03413, W099/31132, W099/36883, W099/56791, W097/28273, W099/5412, W099/58883, W099/55873, and/or N. meningitidis protein PorA, Theating to Component in the composition is used for making a medicament for treating or preventing infection due to Neisserial bacteria; a diagnostic reagent for detecting the presence of Neisserial bacteria or of antibodies raised against Neisserial bacteria; and/or a reagent which can raise antibodies against Neisserial bacteria. It may

                                                                                                adjuvant composition (II) comprising an oligonucleotide which comprises at least 1 CG motif and a complete Frend's adjuvant (CFA), where the oligonucleotide preferably comprises at least one hosphorothicate bond. AAA92359 to AAA92385 represent specifically claimed oligonucleotides of the present invention. (I) is useful for stimulating an immune response in a mammal, preferably a human, against Neisseria infection, preferably Neisseria meningitidis infection and in the manufacture of a medicament for inducing a protective immune response in a mammal. The present sequence represents the claimed Neisseria meningitidis serogroup B amino acid sequence disclosed in GB-9928197.4, which is given in the present
                                                                                                                                                                                                                                              The present invention describes an immunogenic composition (I) comprising a Neisseria antigen and an adjuvant composition comprising an oligonucleotide comprising at least 1 CG motif. Also described is an
                                                                                                                                                                                                                                                                                                                                  Immunogenic composition useful for stimulating an immune response in mammal against Neisseria infection, comprises Neisseria antigen and adjuvant composition comprising an oligonucleotide with a CG motif -

Also described is an adjuvant composition (II) comprising an obligonucleotide which comprises at least 1 CG motif and a complete Freund's adjuvant (CFA), where the obligonucleotide preferably comprises at least one phosphorothicate bond. AAA92359 to AAA92385 represent specifically claimed obligonucleotides of the present invention. (I) is useful for stimulating an immune response in a mammal, preferably a human, against Neisseria infection, preferably Reisseria meningitidis infection and in the manufacture of a medicament for inducing a protective immune response in a mammal. The present sequence represents the claimed Neisseria meningitidis serogroup A amino acid sequence disclosed in GB-9928197.4, which is given in the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    hybridisation complexes. Antigens and antibodies specific omp proteins also provide diagnostic, therapeutic and prophylactic compositions for the treatment or prevention of the infections described above. The antibodies are useful for inducing a protective immune response in humans or animals with N. gonorrhoeae, N. meningitidis, or other Neisseria species. The proteins, antibodies and polynucleotide sequences of the present invention may also be used in the screening and development of chemical compounds such as drugs or vaccines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present sequence represents an outer membrane protein (omp) 85 of Neisseria meningitidis. The omp polypeptides and polynucleotides are useful in compositions for use in the prevention, treatment and diagnosis of non-symptomatic gonococcal infection or meningococcal infection and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 41; Page 89-92; 98pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated outer membrane protein 85 of Neisseria gonorrhoeae and meningitidis useful for vaccine, therapeutic and diagnostic compositions for gonococcal or meningococcal infections

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC polypeptide (II) sequences. (I) is useful as hybridisation probes,
CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome
CC and gene mapping, and in recombinant production of (II). The
CC for identifying expressed genes. (I) is useful in gene therapy techniques
CC for identifying expressed genes. (I) is useful in gene therapy techniques
CC (II). (II) is useful for generating antibodies against it, detecting or
CC quantitating a polypeptide in tissue, as molecular weight markers and as
CC a food supplement. (II) and its binding partners are useful in medical
CC imaging of sites expressing (II). (I) and (II) are useful for treating
CC disorders involving aberrant protein expression or biological activity.
CC The polypeptide and polynucleotide sequences have applications in
CC diagnostics, forensics, gene mapping, identification of mutations
CC responsible for genetic disorders or other traits to assess blodiversity
CC and to produce other types of data and products dependent on DNA and
CC diagnostic amino acid sequences. ABG00010-ABG30377 represent novel human
CC diagnostic amino acid sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                  AAX91536 to AAX91801 encode two hundred and sixty six antigenic Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAX94583. AAX91802 to AAX91899 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  10-DEC-1998

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Porphorymonas gingivalis (PG) polypeptide sequences given in AAY34318 to AAY34833. AAX91802 to AAX91989 represent PCR primers used in the isolation of the PG polypeptides. The PG polypeptides have antibacterial activity with a vaccine mechanism of action. The PG polypeptides can be used as vaccines especially against Porphorymonas gingivalis. Probes can be used to detect Porphorymonas gingivalis in standard hybridisation assays. Porphorymonas gingivalis is involved in periodontal disease

                                                              Matches
                                                                                                               Query Match
                                                                                                                                                                                                             AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54573 to AAZ54576 and AAZ54616 to AAZ54473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves have use as antibacterial agents. The polynucleotides of the invention may also be used in gene therapy protocols.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       09-OCT-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a putative version of the Neisseria meningitidis strain ATCC13090 BASB040 protein sequence. This protein is similar to the D15 outer membrane protein of the bacterium. The protein, its gene, antibodies, antagonists and agonists can be used to diagnose and treat bacterial diseases such as those leading to upper respiratory tract infections, bacteraemia and meningitis. In addition, they can be used in vaccines for use against cancer and autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 4; Page 60-61; 98pp; English

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a putative version of the Neisseria meningitidis strain H44/76 BASB040 protein sequence. This protein is similar to the DIS outer membrane protein of the bacterium. The protein, its gene, antibodies, antagonists and agonists can be used to diagnose and treat bacterial diseases such as those leading to upper respiratory tract infections, bacteraemia and meningitis. In addition, they can be used in vaccines for use against cancer and autoimmune diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  밁
            AAZ53015 to AAZ54536, AAZ54577 to AAZ54615, and AAY74253 to AAY75941 represent novel Neisseria meningitis and N. gonorrheae polynucleotides and polypeptides. AAZ54537 to AAZ54536 and AAZ54616 to AAZ54473 represent PCR primers used in the exemplification of the present invention. The polypeptides, the polynucleotides, antibodies and compositions of the invention can be used as vaccines, as diagnostic reagents, and as immunogenic compositions. The polypeptides can be used in the manufacture of medicaments for treating or preventing infection due to Neisserial bacteria (e.g. meningitis and septicaemia), to detect the presence of Neisseria bacteria, or to raise antibodies. They may also be used to screen for agonists or antagonists, which may themselves
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               09-OCT-1998;
